

EXERCISE: USE A HOOK (CONT'D)

- ▶ **Add a “before each” hook to the “when passed a single argument --foo” which prepares the scenario for the two tests**
- ▶ Hint: the *only* function call in each *test body* will be the given *assert* function call
- ▶ Hint: declare a variable in the *suite body* and define the variable in the *hook body*

Docs: <https://mochajs.org/#hooks>

OUTPUT: USE A HOOK

```
when opts.expectsValue is an object
```

```
  ✓ should throw a TypeError
```

```
when opts.expectsValue is a nonzero number
```

```
  ✓ should throw a TypeError
```

```
when passed a single argument "--foo"
```

```
  ✓ should return an object having property foo: true
```

```
  ✓ should return an object having no positional arguments
```

```
4 passing (10ms)
```
