ANSWER: RUN THE "HELLO WORLD" TEST

test/bargs.spec.js

```
if (true) {
  throw new Error('test failed');
}
```

WHAT'S WRONG WITH WRITING TESTS THIS WAY?

▸ It works… but too much boilerplate

▸ *Assertion patterns* will emerge, including:

  ▸ Is x true? Is x false?

  ▸ Does x equal y?

  ▸ Does function z throw? If so, which exception?

  ▸ Is x in array y?
